

Reflection positive representations and Hankel operators in the multiplicity free case

Maria Stella Adamo

University of Tokyo (Japan)

In joint work with K.-H. Neeb and J. Schober, we studied reflection positive representations by using positive Hankel operators. In this talk, we will discuss our new approach, mainly in the case of the integers and the real line. We showed that for these groups positive Hankel representations produce reflection positive representations in the regular multiplicity free case.
